

Budget Manager

Proposal

- Create a budget app that keeps track of expenses and savings with an intuitive interface and friendly user.
- Create a MERN stack app

Objectives

-
-
-

Create a functional app
Create a React app
Make Budget Manager Real

Outcome

A part functional full-stack app

As much as it was intended to create full app, the logic and the libraries were installed however the code was unable to run, and by that i mean that connecting to the database for competing the next step was unable as there was a network connection error that till today im still troubleshooting however, i cannot wait longer for finding a solution, leaving me with not choice than hard coding the data as if it was making the request from the database.

The app renders and works perfectly fine from React as well as from the server side that like Node and Express, however MongoDB was never able to connect after different troubleshootings.

As a recommendation i would be posting both repositories separately as i will still be working on it, till i find out why it wasnt possible, my marks may get affected by this error however the amount of the knowledge that i have gained through this mistakes has been massive, follow the repos for checking out if i was able to deploy to the Mongo.
